## Session 4 – Main Theme Architecture Blueprinting (High-Level Analysis & Design)

**Dr. Jean-Claude Franchitti**

*New York University  
Computer Science Department  
Courant Institute of Mathematical Sciences*

# Agenda

**1 Introduction**

**2 High-Level Analysis and Design**

**3 Architecture Blueprinting**

**4 Sample Architecture Blueprints**

**5 Architectural Mapping Process Illustrated**

**6 Reference Architecture Cataloguing Framework**

**7 Summary and Conclusion**

# High-Level Analysis and Design in Brief

- High-Level Analysis and Design Processes
- Architecture Blueprinting
- Sample Architecture Blueprints
- Architectural Mapping Processes
- Reference Architecture Cataloguing Framework
- Summary and Conclusion

Information

Common Realization

Knowledge/Competency Pattern

Governance

Alignment

Solution Approach

# Agenda

- 1 Introduction

- 2 High-Level Analysis and Design

- 3 Architecture Blueprinting

- 4 Sample Architecture Blueprints

- 5 Architectural Mapping Process Illustrated

- 6 Reference Architecture Cataloguing Framework

- 7 Summary and Conclusion

- The goal of high-level analysis and design is to quickly produce a **high-level model** that reflects the current understanding of the future state architecture
- This high-level model is helpful in putting together high-level program/project estimate and providing a **view** of the future state that can be used as a starting point
- Various architecture models may be used to represent this view and they are typically based on **blueprinting notations/process** and **blueprints** that have been standardized within the Enterprise working on the high-level analysis and design
- There are currently no industry standard blueprinting notation/process and/or blueprints; the blueprinting process typically goes top down to document the various facets of the future state architecture starting from the **Enterprise** level and going through the **business**, and **technology architectures**
- Technology architecture blueprinting can be conducted in parallel at the application, data, and technical levels

- An Architecture provides the organizing logic for mapping business onto IT capabilities
- Creating models to describe an Architecture is a complex exercise as various levels of abstractions may need to be considered to effectively cover all requirements in increasing levels of detail
- Architecture Models are typically based on an integration of existing reference architecture styles
  - » e.g., OMA and SOA, SOA and BPM, etc.

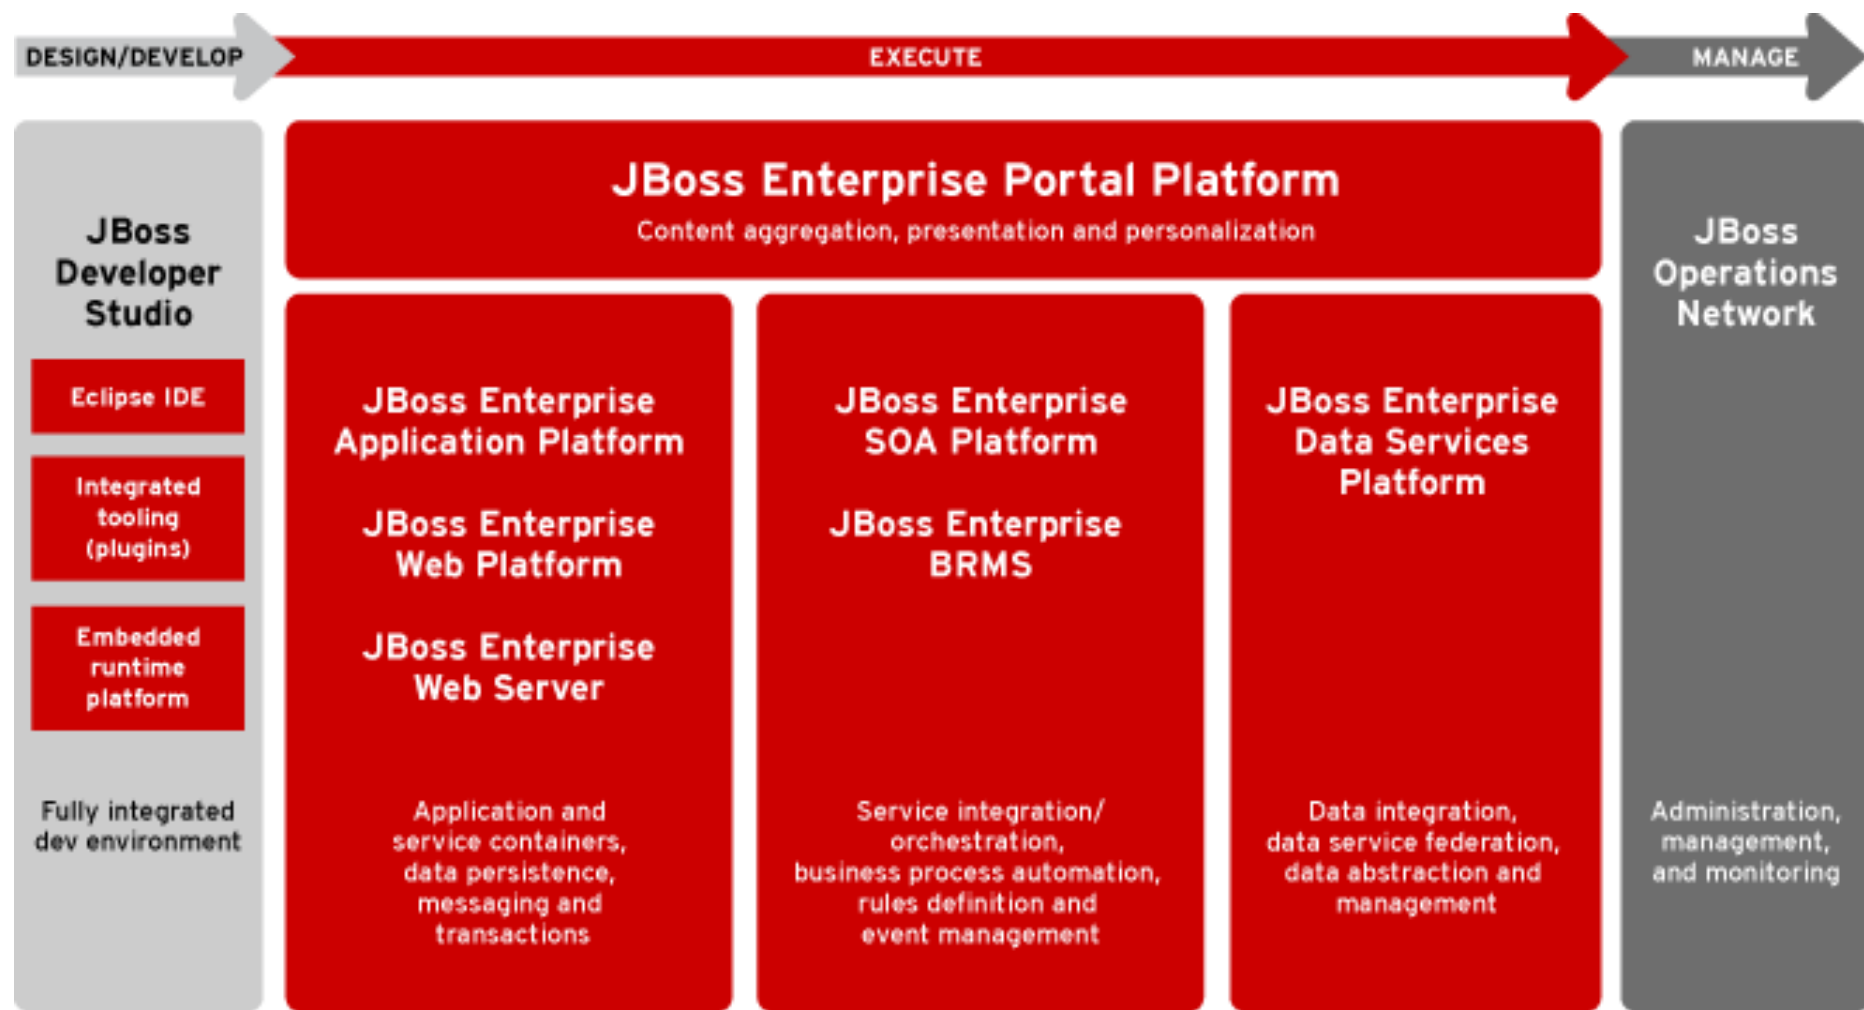

**A Reference Architecture consists of foundational principles, an organizing framework, a comprehensive and consistent method, and a set of governing processes and structures.**

- Principles provide the foundation upon which the Reference Architecture is based. It includes a set of architectural terms as well as numerous principles, policies, and guidelines for governing the architecture.
- Framework is the organizing basis for the Reference Architecture and defines the architectural domains and disciplines that enable separation of concerns and IT to business alignment.
- Method is the comprehensive set of defined repeatable processes that are followed for a consistent and controlled realization of the Reference Architecture.
- Governance is the set processes and organizational structures that ensure conformity to the Reference Architecture.

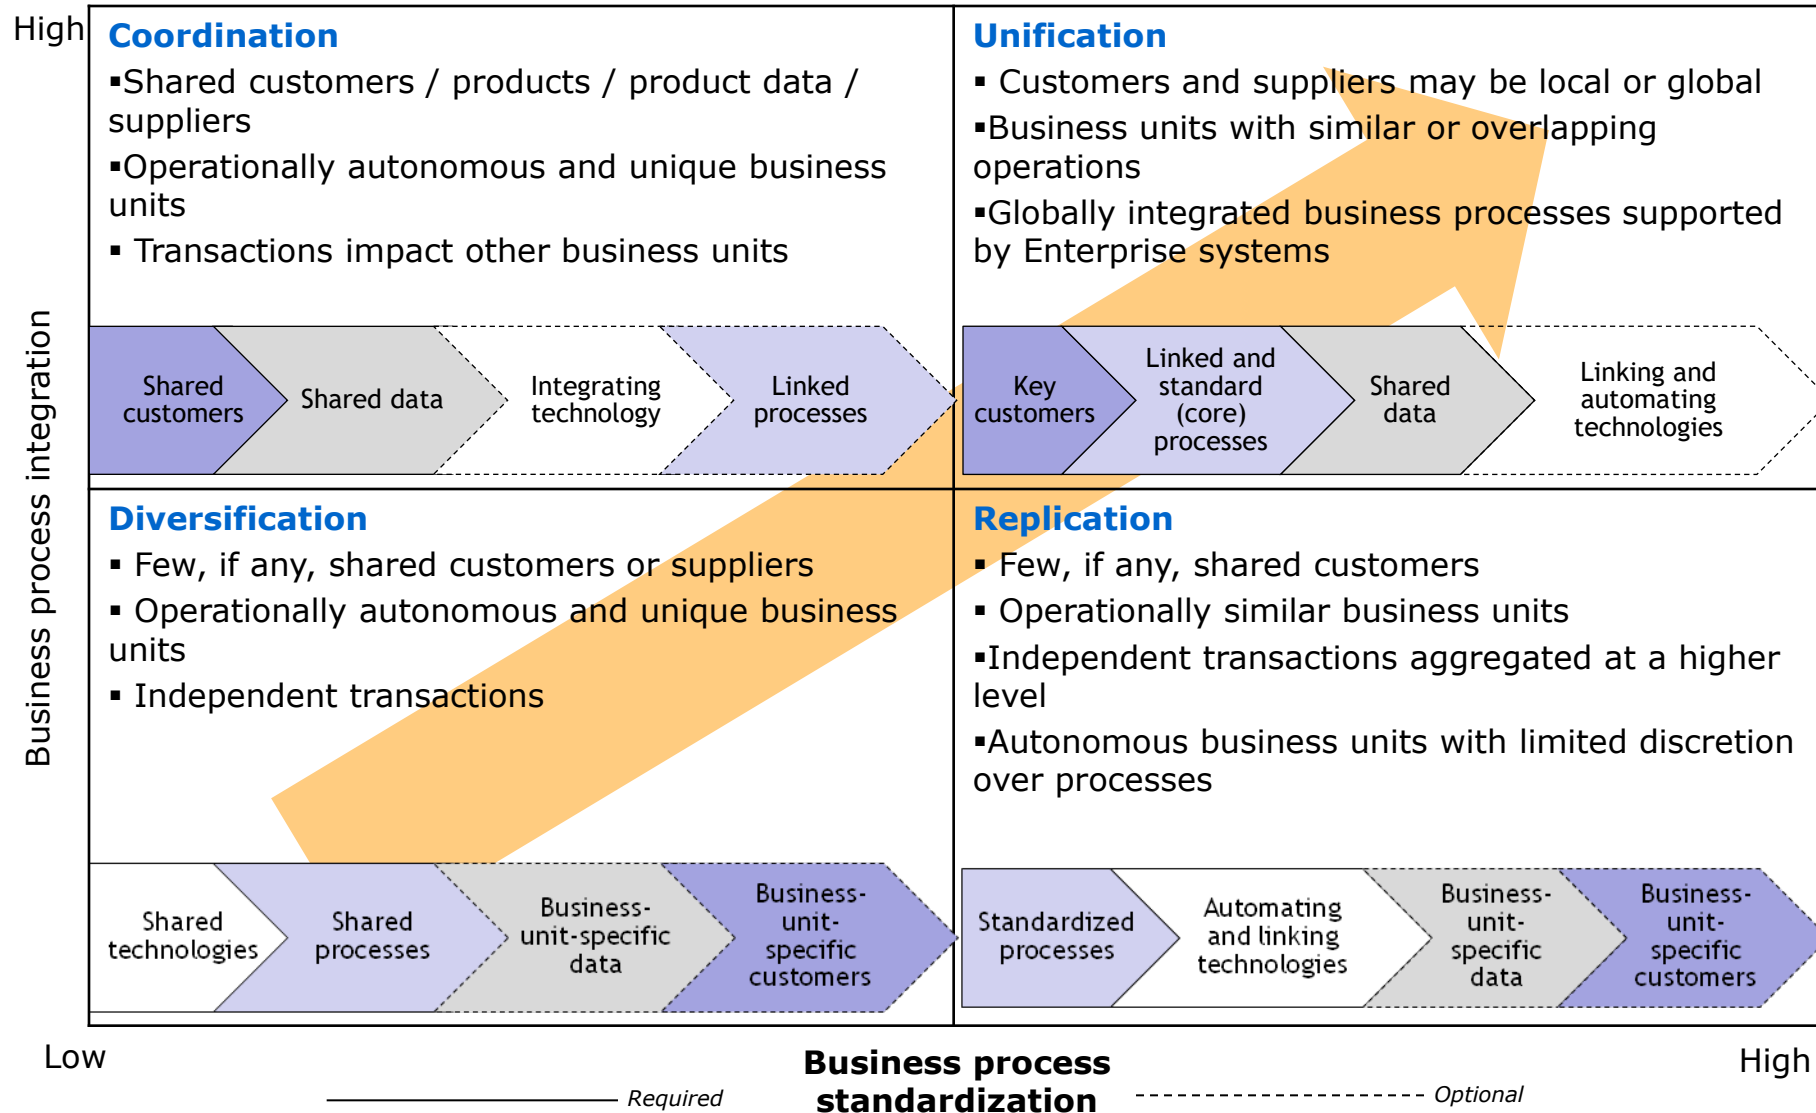

- A “reference” architecture model is an accepted representation of the architecture that drives the mapping of business capabilities onto IT capabilities
- A reference architecture model may not represent any specific organization needs
- A reference architecture model is rarely developed using a top-down or bottom-up approach, it is typically put together by integrating requirements from various architectural domains according to accepted heuristics (e.g., reuse via unification or best practices / standardization) and using accepted frameworks

# Enterprise Architecture Modeling Heuristics

- Architects working at the Enterprise, Portfolio, and System levels use different models to represent their own views of a given architecture

Architecture Scope	Architecture Domain				Level of Abstraction
	Business Architecture	Data Architecture	Application Architecture	Technical Architecture	
Enterprise					Presentation
Portfolio / Domain					Conceptual
System (Project)					Logical
					Physical

- An Architecture Asset Catalog enables the representation of stakeholder views in matrix form to help catalog such models

- The level of abstraction refers to how far a blueprint is removed from “practical” considerations such as application servers, programming languages, DBMS technology, etc
- Although the levels of abstraction vary by architecture domain, four different types levels are recognized:
  - > **Presentation** - a stylized model intended to greatly simplify an architecture so that key messages can be effectively communicated, typically to business leadership
    - Presentation level diagrams are generally created by summarizing lower level architecture diagrams.
  - > **Conceptual** - a highly generalized yet more formal depiction of an architecture that suppresses much of the actual detail -- either because the details are not important to the model and/or they had not been decided at the time the diagram was created
  - > **Logical** - a detailed representation of an architecture that is generally independent of the underlying technology that is used (or will be) used to implement an architecture.
  - > **Physical** - A representation that is typically dependent on the underlying technology that will be (or is) used to implement an architecture.

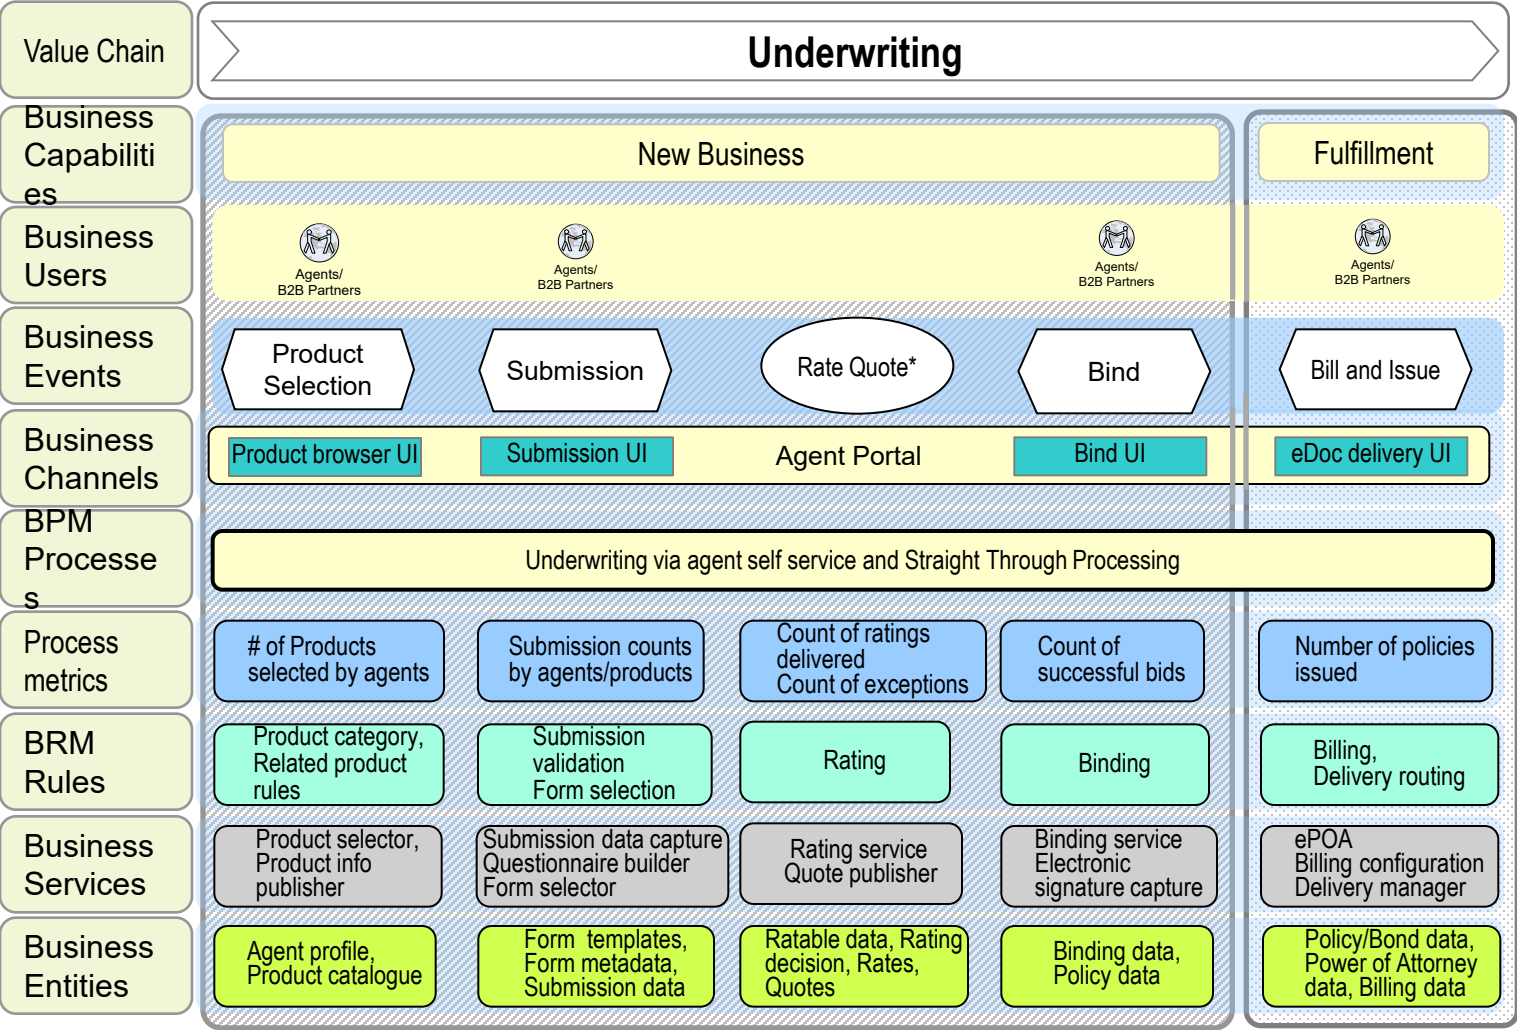

- In this context, relevant views are those that match the phases of an solution development life cycle

		Enterprise Perspectives			
		Business	Information	Application	Technology
Architecture and Solution Engineering Views	Analysis/Design				
	Implementation				
	Product				
	Deployment				

Value Chain	Sales and Marketing	Product Development	Underwriting	Finance and Accounting	Servicing	Claim Processing
Business Capabilities

BRM Rules						
Business Services						
Business Entities						

# Conceptual Business Architecture Framework Illustration

# Agenda

- 
- 1 Introduction
  - 2 High-Level Analysis and Design
  - 3 Architecture Blueprinting
  - 4 Sample Architecture Blueprints
  - 5 Architectural Mapping Process Illustrated
  - 6 Reference Architecture Cataloguing Framework
  - 7 Summary and Conclusion

- Blueprinting is fundamentally concerned with the high-level representation of intangible assets (e.g., applications, databases, interfaces, networks, servers, etc.) so that:
  - » The interrelationship between the various assets can be understood
  - » The assets may be changed more reliably
  - » Architectural level design decisions become observable

- A blueprint is an architectural drawing
  - » Created using a consistent representation to represent a high-level model of the as-it, to-be, or in-transition IT environment
- Unlike UML models, which are software engineering level diagrams, blueprints are at an architectural-level of detail and provide the context needed to visualize the “big picture”
  - » As such, blueprints are analogous to the “city-planning” level in the building construction industry
  - » They enable architects to communicate the overall design of the city as opposed to the design of the individual buildings that make up the city

- The appearance of a blueprint varies considerably depending upon a number of factors including:
  - » The architectural domain being modeled (e.g., application architecture versus technical architecture)
  - » The scope of the blueprint (e.g., Enterprise, Portfolio, Project)
  - » The level of abstraction (e.g., Presentation, Conceptual, Logical, Physical)
  - » The communication objectives of the model
- Blueprints are also used to document and define three different states of technology evolution
  - » A current state called the **As-Is** or POD
  - » A future state called the **To-Be** or POA (typically 12 - 24 months out)
  - » One or more transition states, each one called a **Transition** or planned landing point between the as-is and to-be state
    - Once implemented, a Transition represents a new As-Is state

- In the absence of standardized blueprinting techniques, architectural models would be highly individualized and would range from artifacts that may be fairly structured to models that would be very general and stylistic
- As a result, the readers interpreting the models would be required to ask (and assume an answer to) a number of critical questions including:
  - » *What concepts is the model attempting to explain?*
  - » *Are the concepts highly abstract or is the model depicting a precise design?*
  - » *What do the symbols on the diagram represent?*
  - » *What architecture domain is being modeled?*
  - » *Does the design apply to the Enterprise as a whole, a LOB, a portfolio, or a project?*
  - » *Does the model represent the As-Is , To-Be, or Transition architecture?*
  - » *If the model represents a Transition architecture, what changes to the IT environment are being planned?*
  - » *etc.*

- Blueprinting and UML are intended to be used together on the same project
- Blueprint artifacts are used to document the end-to-end high-level designs for projects
  - » *Blueprints are analogous to the “city-planning” level in the building construction industry*
  - » *They enable architects to communicate the overall design of a city (project) as opposed to the design of the individual buildings (applications) that make up the city*
- UML artifacts are used for software engineering tasks (e.g., architecting the buildings)

	UML	Blueprinting
<b>Focus</b>	Software development	Application integration
<b>Use</b>	Analyze and design software systems and modules, typically using an OO approach	Describe or prescribe an end-to-end design without delving into details
<b>Level of detail</b>	High to low-level	High-level
<b>Central Element of Granularity</b>	A system and its subsystems	System of systems
<b>Learning Curve</b>	Significant	Minimal

- *According to Research Analysts and reports...*
  - » Modeling at the Enterprise and Portfolio levels tends to be fairly generalized
    - The goal at these levels is to communicate the “big picture” (as opposed to “application-level” designs)
  - » UML is an OO modeling system with schematics and notations for application development (e.g., “building-level” designs)
    - It is not well suited for modeling portfolio and Enterprise level architectures (e.g., the “city-level” or “big picture” designs)
  - » There may never be industry standards at the Enterprise and Portfolio levels

Sample Legend Box		
Architecture Domain:	Application	Scope: Project
Blueprint Type:	Info Flow Diagram	Abstraction: Logical
State:	As-Is	
Revision Date:	06/14/09	Status: Working Draft
Revised By:	John Doe Architect	
Approved By:	Jane Doe Architect	

- The Legend Box is a text box that must appear on all blueprints. It is used to denote important information that is needed by the reader to correctly interpret a blueprint. The following information is included in the Legend Box:
- **Architecture Domain** - Used to specify what aspect of the environment is the subject of architecture artifact - One of the following domains must be specified:
  - *Business Architecture* —specify this when the model depicts the company's business capabilities, business processes, organizational structure, major locations, or relationships with partners and customers
  - *Application Architecture* — specify this when the model depicts the application assets that support business capabilities and processes
  - *Data Architecture* —specify this when the model depicts the company's business rules, business data and/or information types, along with their interrelationships
  - *Technical Architecture* —specify this when the model depicts hardware and facilities, system software, data storage resources, networks, and other underlying technologies
    - Technical architecture provide the platform that supports the activities and interfaces of the other domains

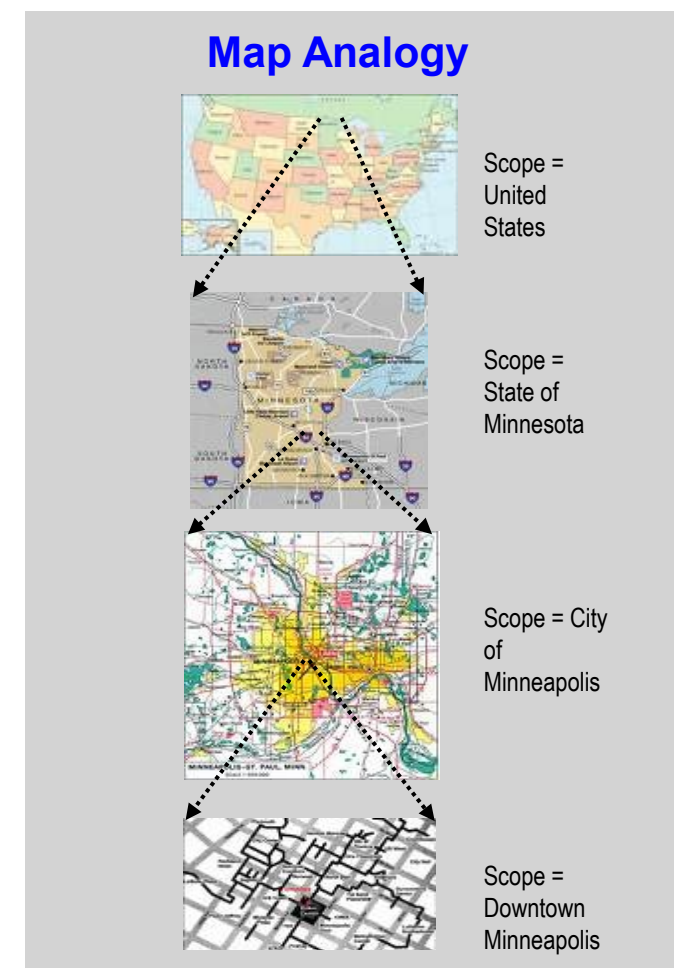

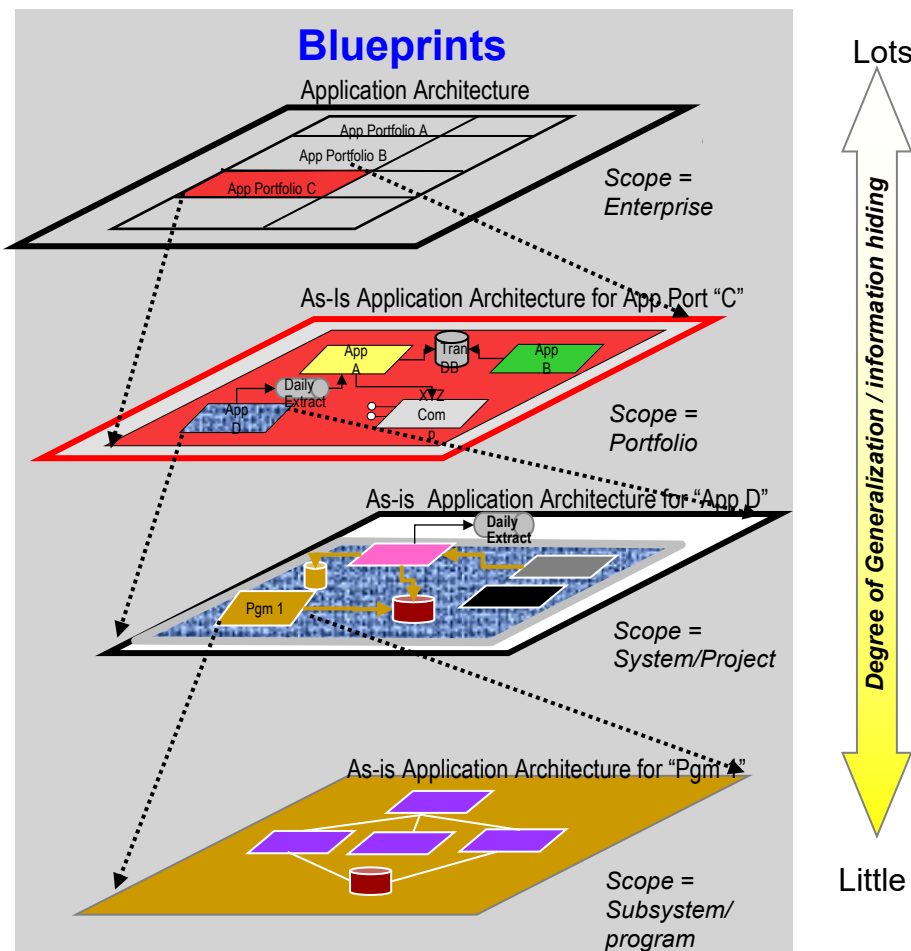

- **Scope** - Defines the breath (or scope of authority) for a blueprint. Several different scopes are recognized:
  - *Enterprise* - A model that generally depicts a company's environment as a whole
  - *Portfolio* - A model that depicts the architecture of a portfolio (e.g., Field Management)
  - *Program/Project* – A model that depicts the architecture of a program or project
  - *Asset* - A diagram that depicts the architecture of an asset
  
- **Abstraction** - Refers to how far the model is removed from “practical” considerations such as application servers, programming languages, etc
  - » Four different levels are recognized: Presentation, Conceptual, Logical and Physical
  
- **State** – Used to answer the question: *Does this model represent the current state or some proposed future state?* Three different states are typically recognized:
  - » As-is - the current state.
  - » To-be - the desired future state that is to be achieved in a specified time period (typically 12 – 24 months). In reality, the to-be state is a moving target that generally represents an aspiration, as opposed to a fixed target that will be achieved
  - » Transition - a planned landing point between the current state and the to-be state
    - A Transition diagram shows progress towards the future state
    - Once implemented, a transition architecture represents the new As-Is and the previous current As-Is becomes the As-Was

# Importance of the Scope of a Blueprint

- Specifying the scope of a diagram is critical because there is a direct correlation between the scope and the amount of detail that can be depicted on a blueprint. The reason is that the amount of generalization (e.g., simplification, feature selection, grouping, etc.) must increase with the scope of the blueprint. The following examples illustrate this key point:

# Agenda

- 4 Sample Architecture Blueprints
- 5 Architectural Mapping Process Illustrated
- 6 Reference Architecture Cataloguing Framework
- 7 Summary and Conclusion

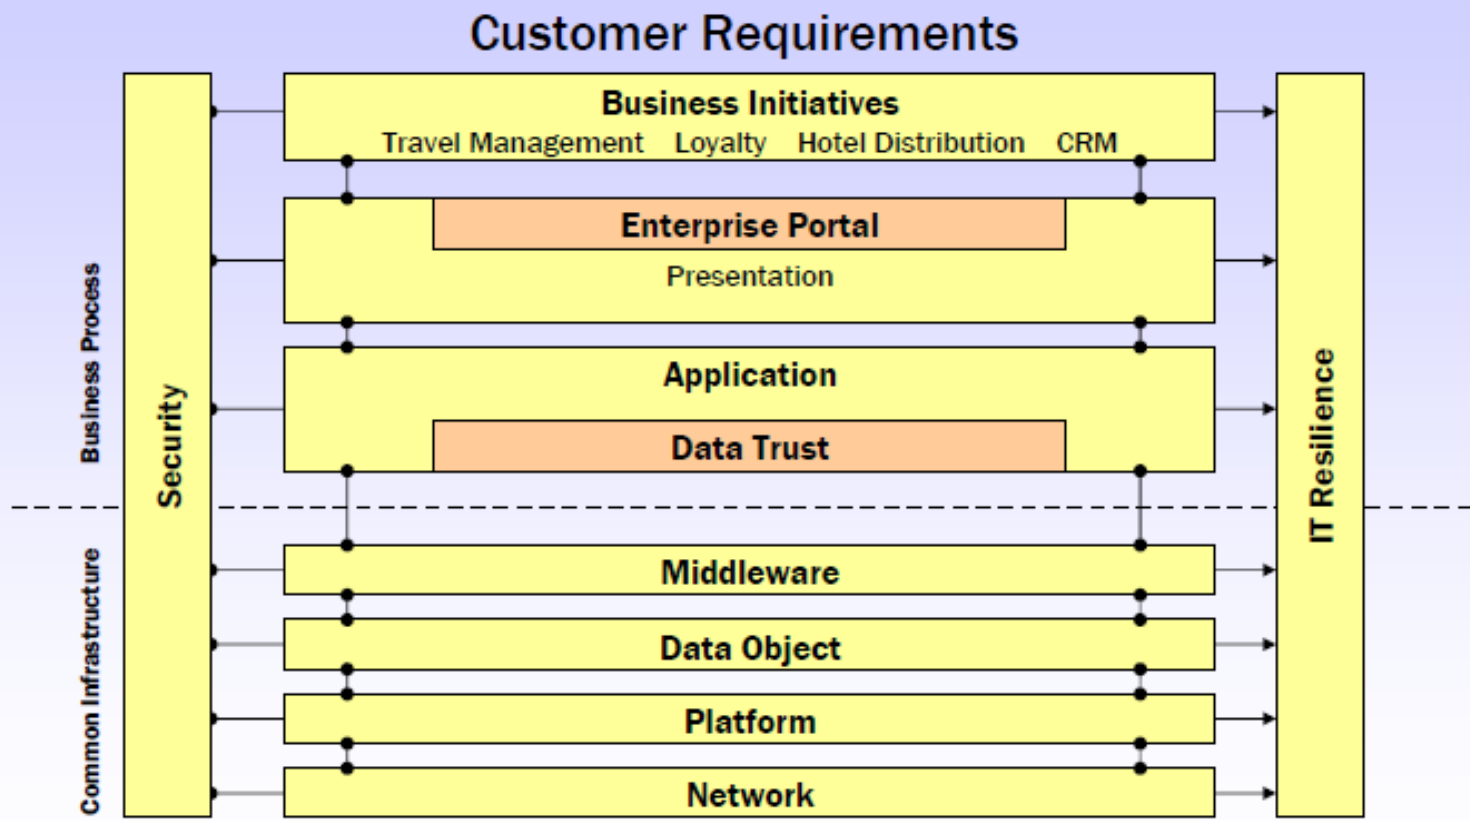

# Delta Air Lines' Enterprise Architecture

# Enterprise Architecture for Carlson's Diversification Operating Model

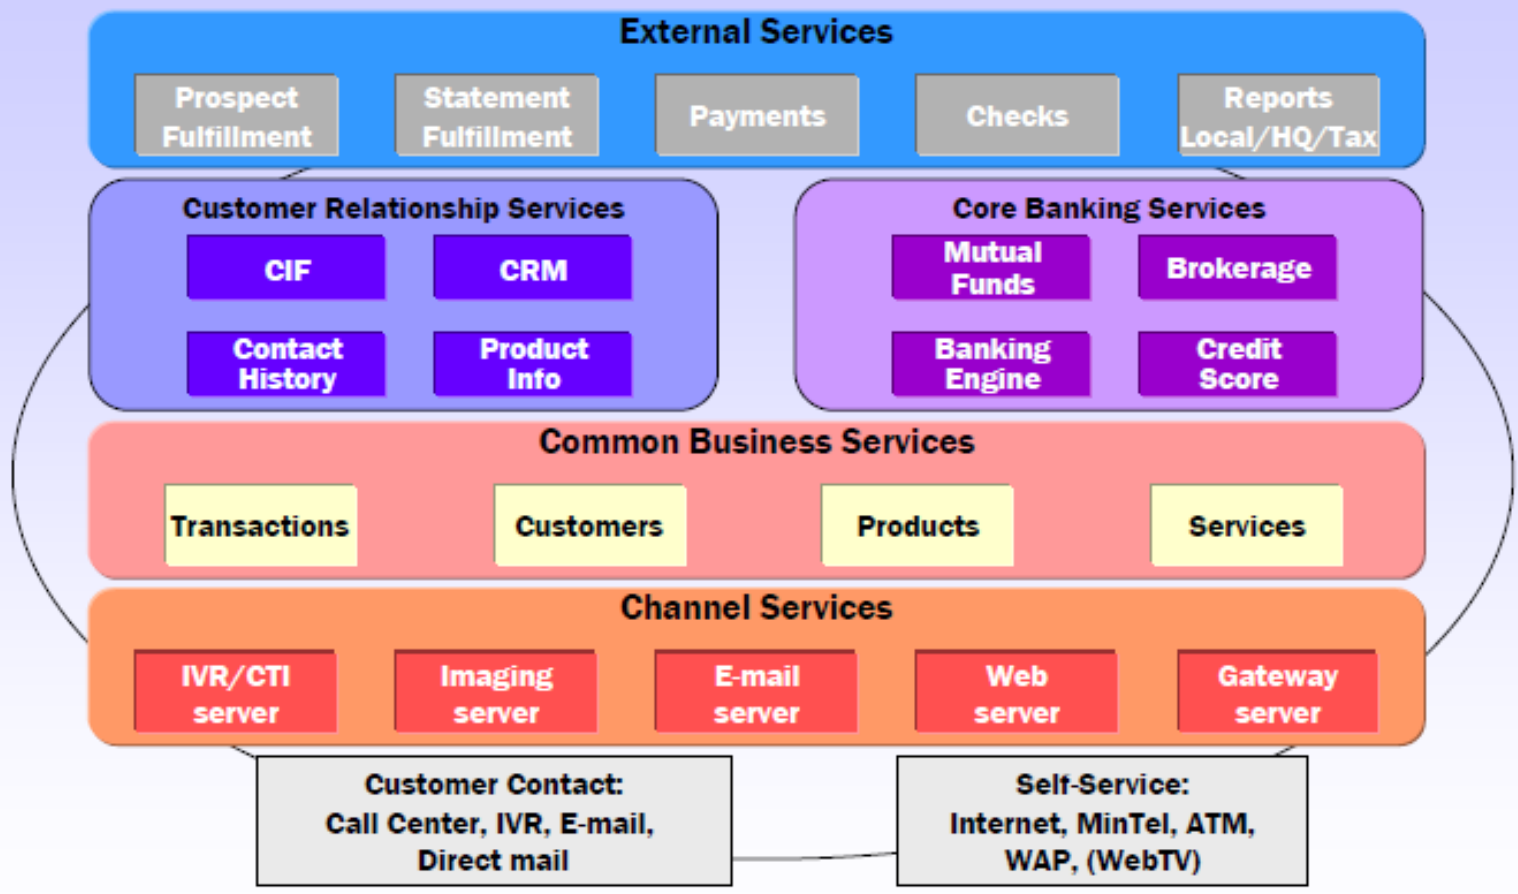

# Enterprise Architecture for MetLife's Coordination Model

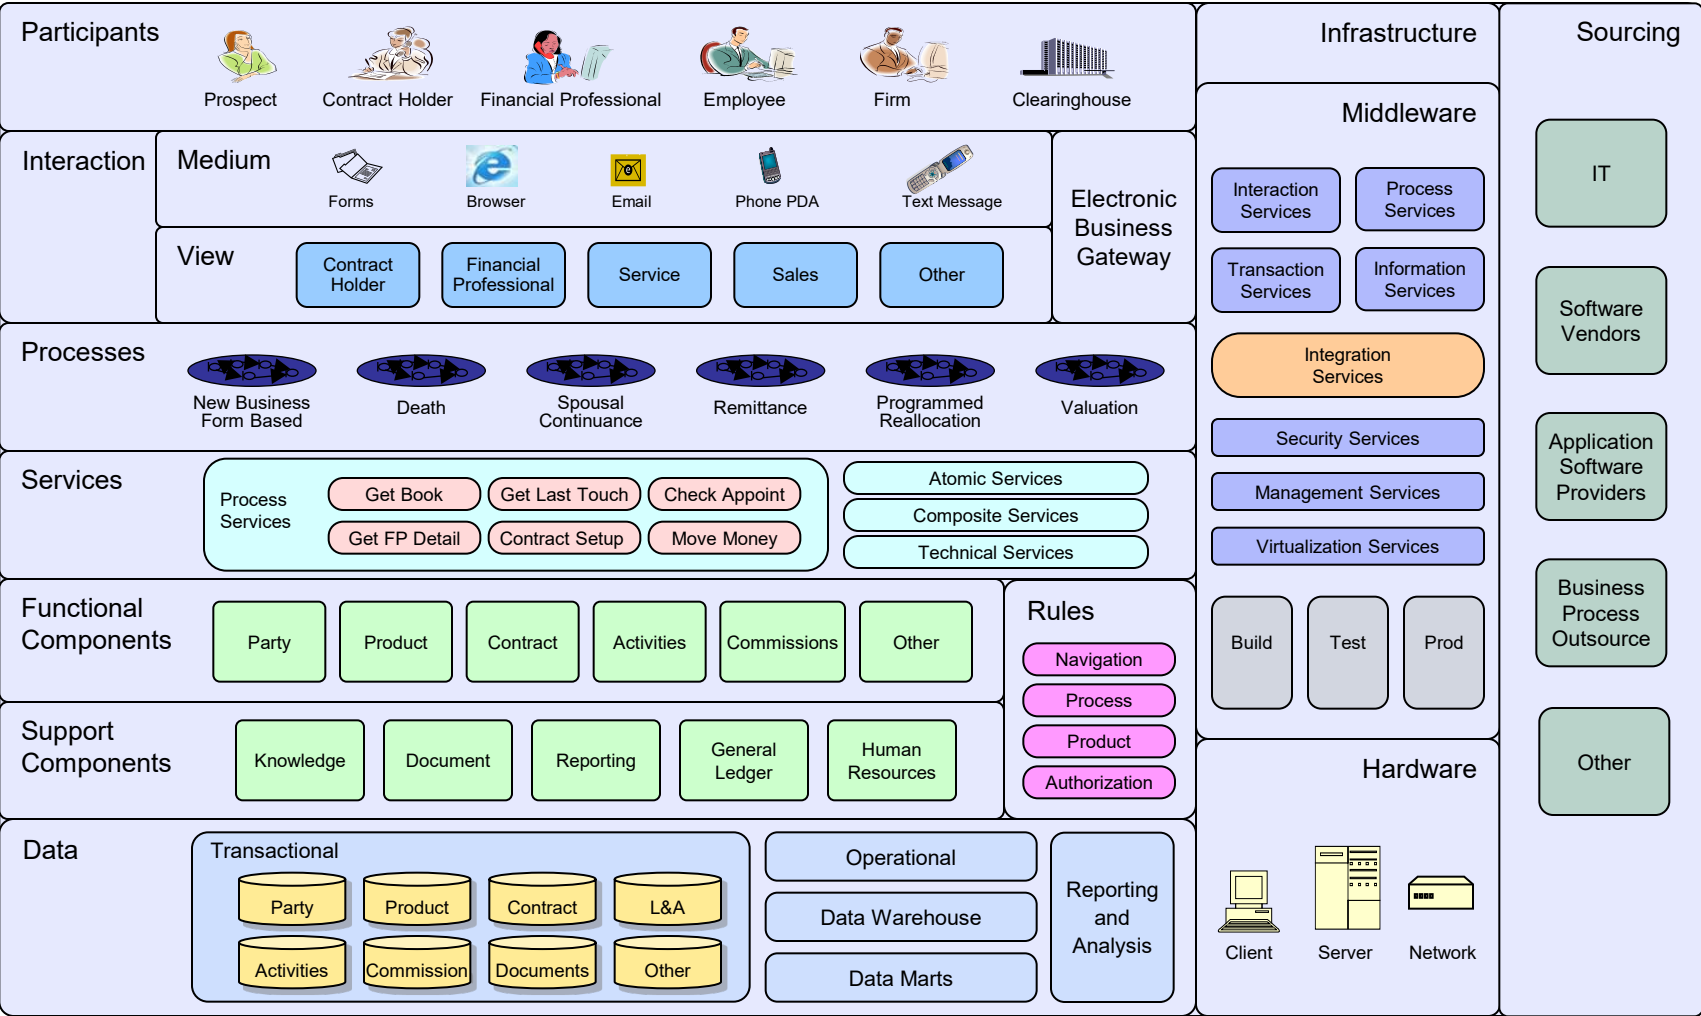

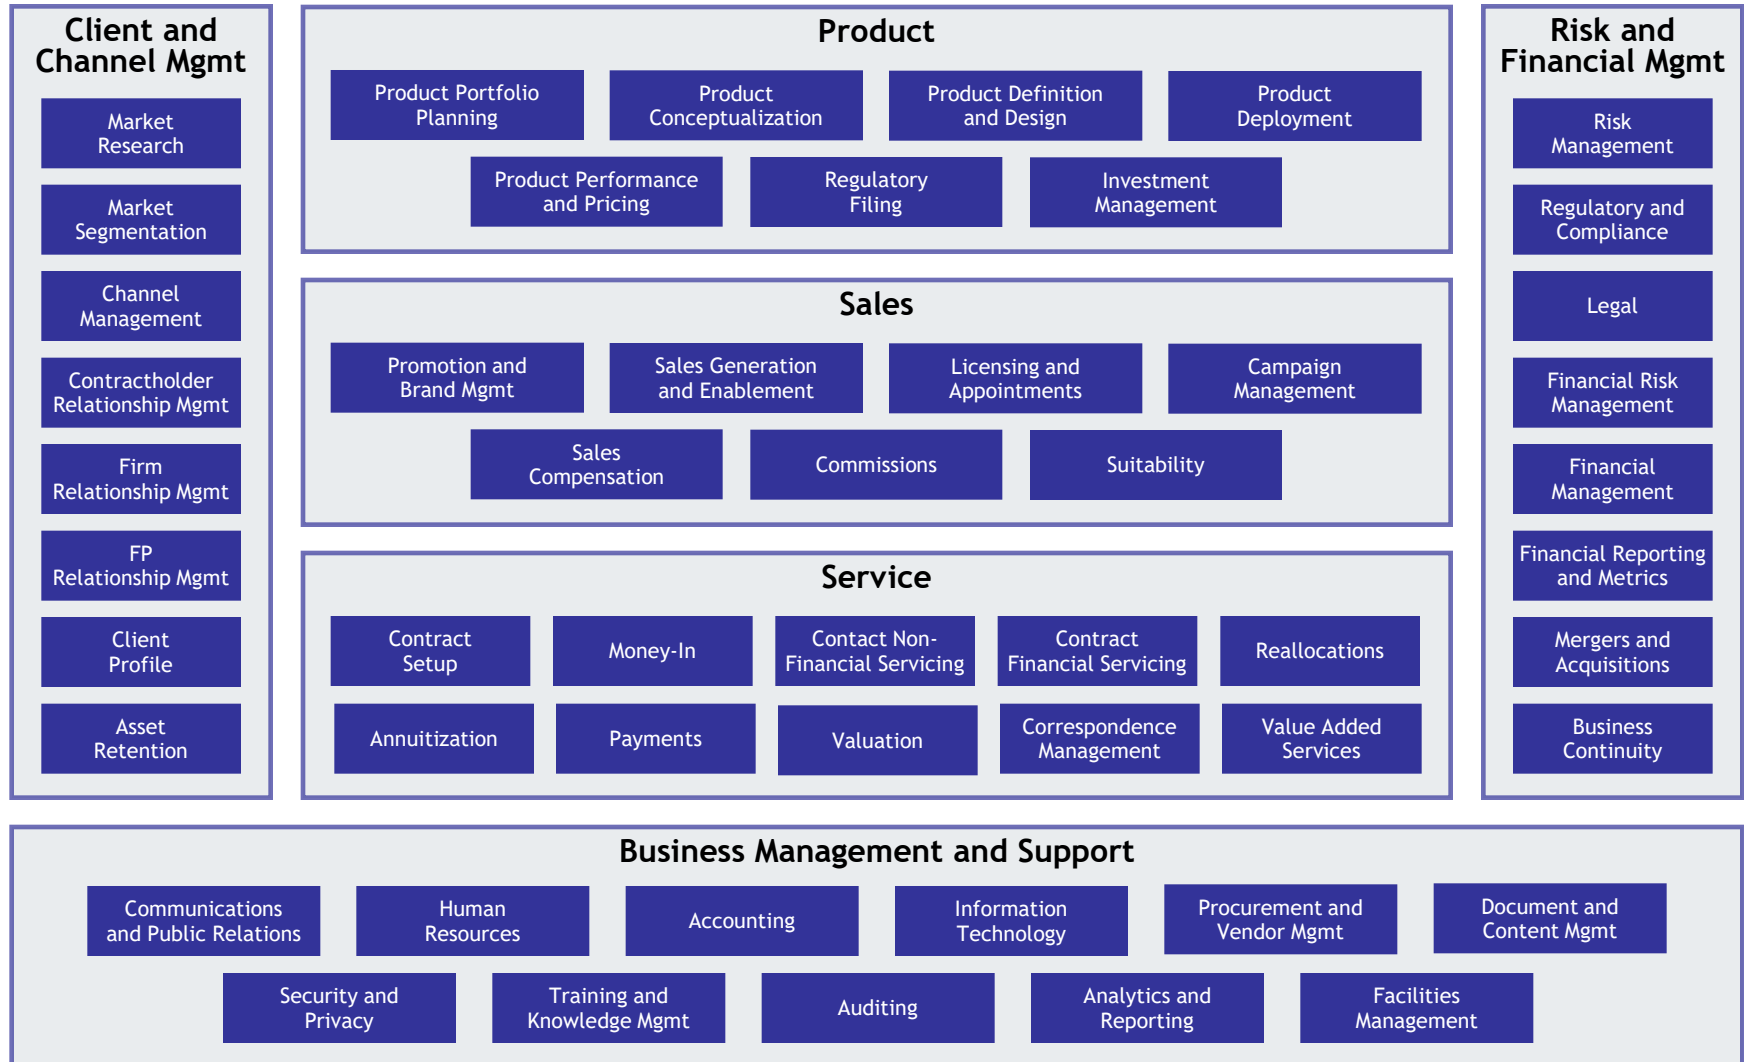

# Enterprise Architecture for ING DIRECT's Replication Model

# Sample Reference Enterprise Architecture Blueprint

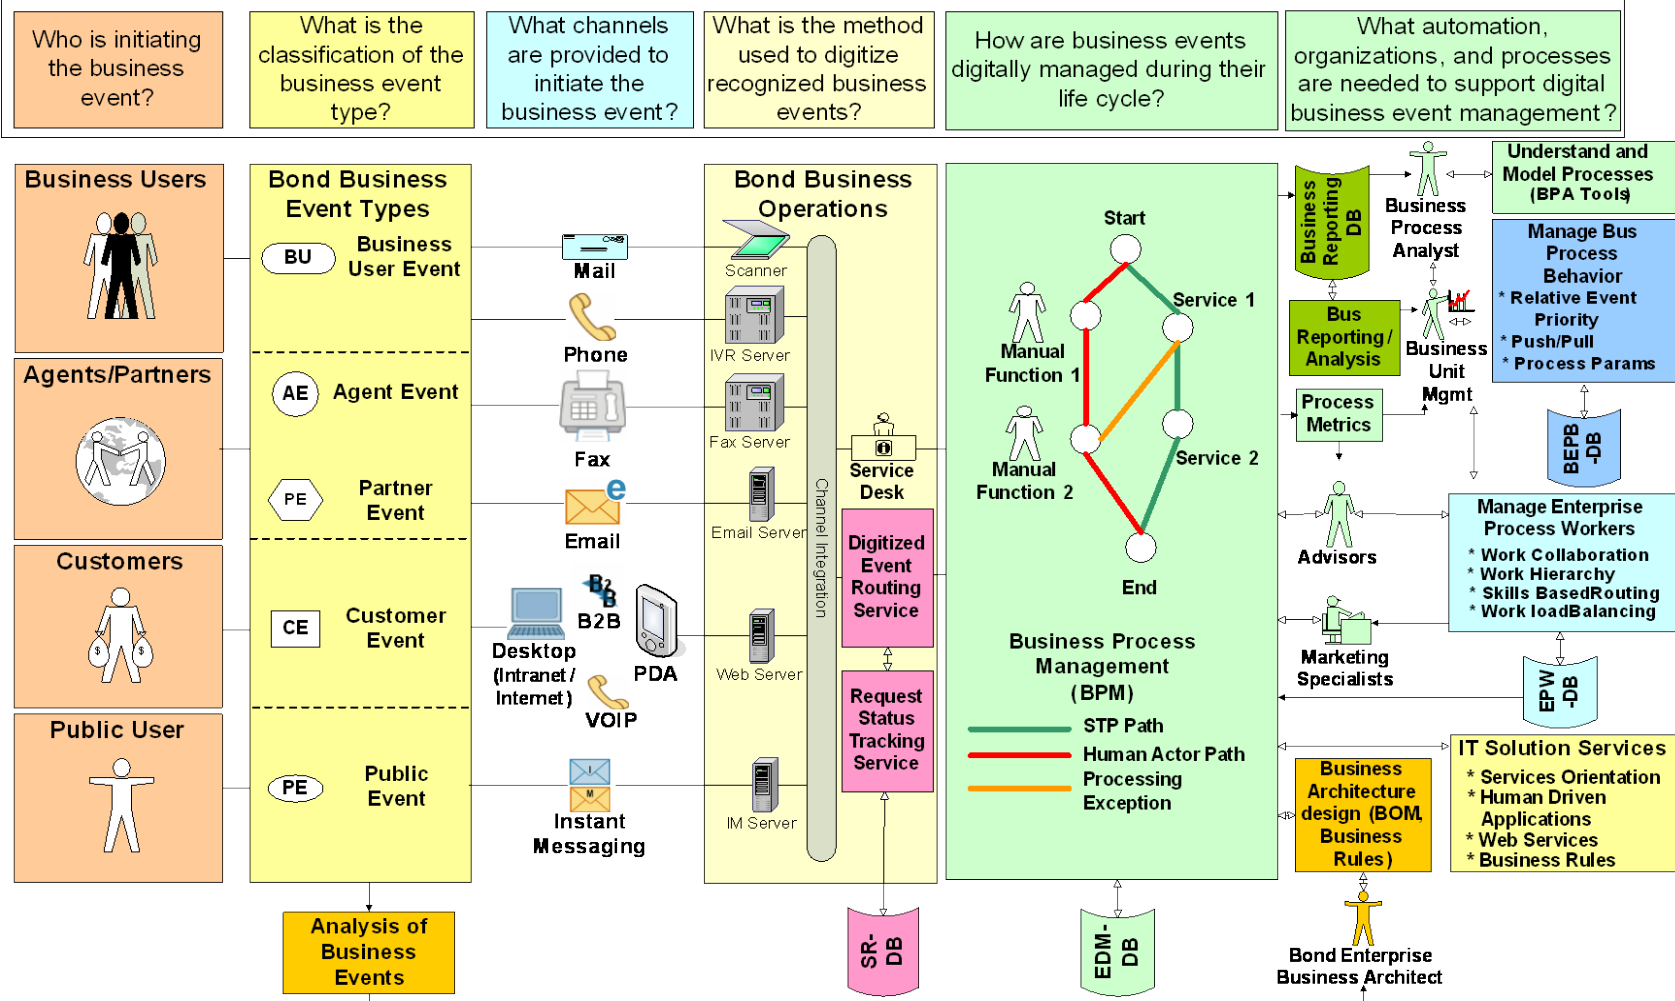

# Sample Detailed Level Business Architecture Blueprint

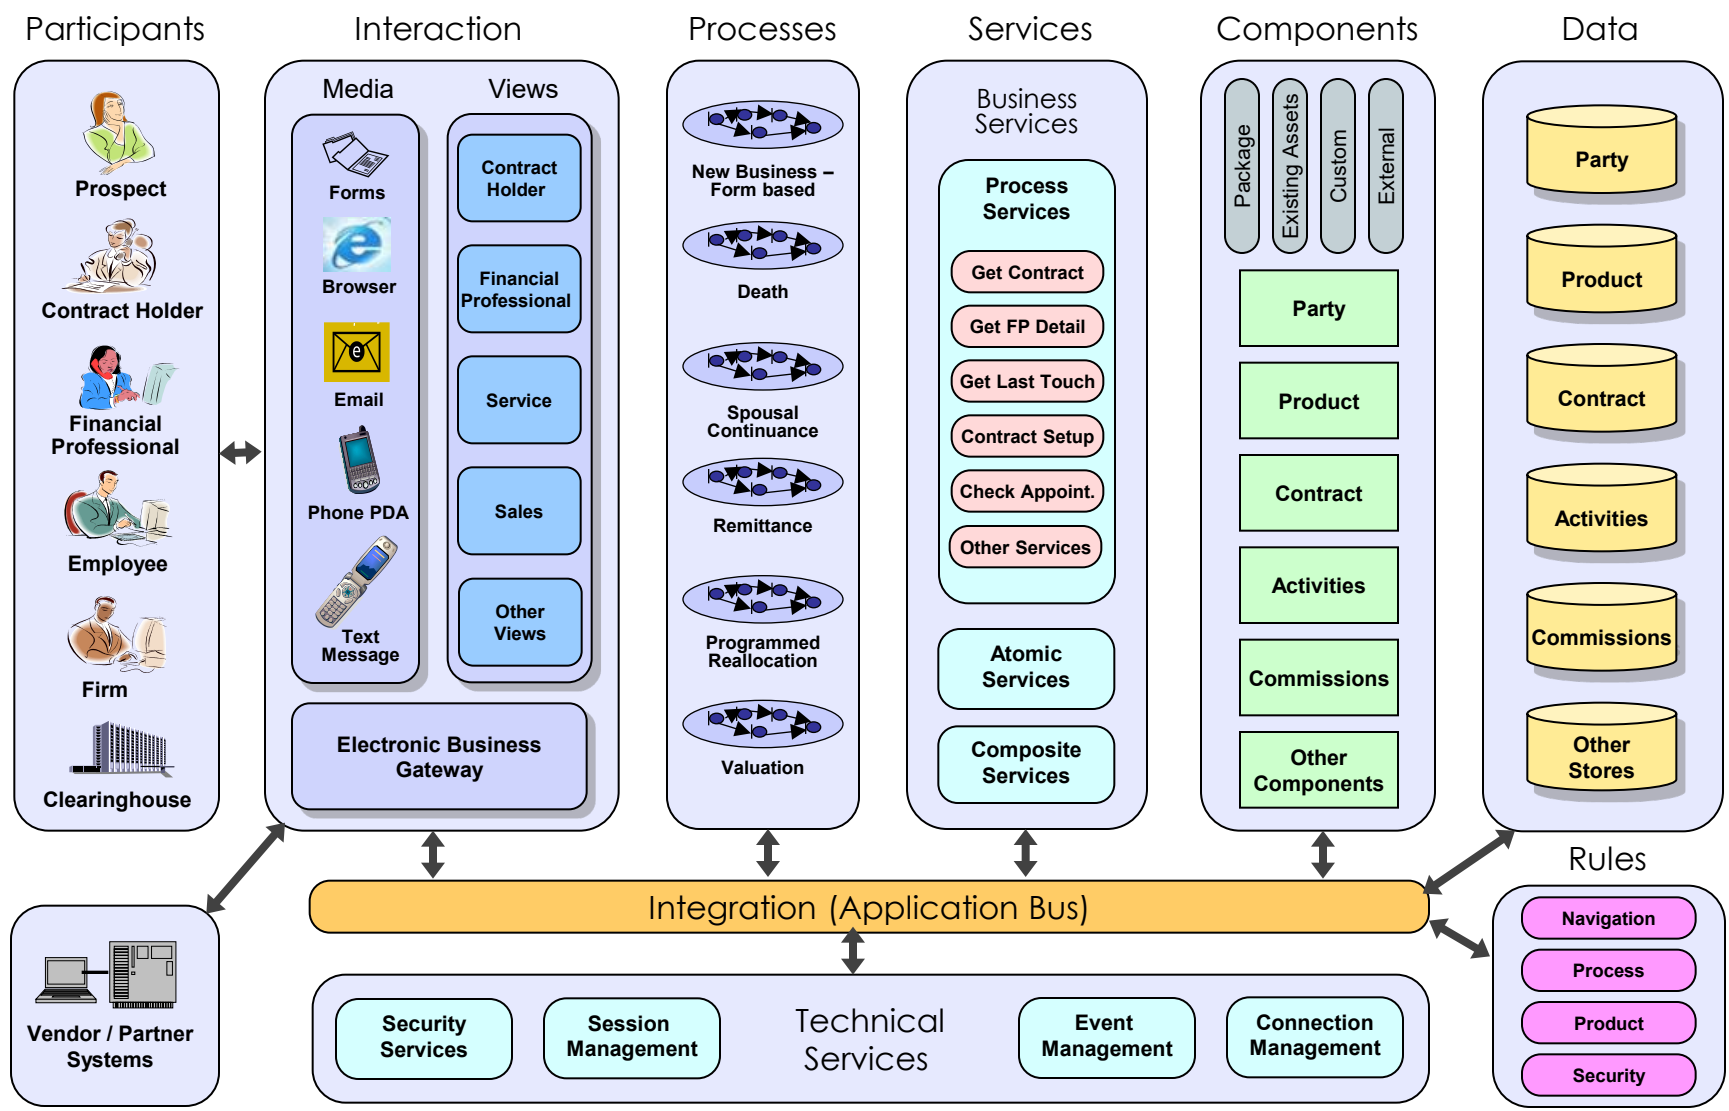

# Conceptual Technology Architecture Blueprint

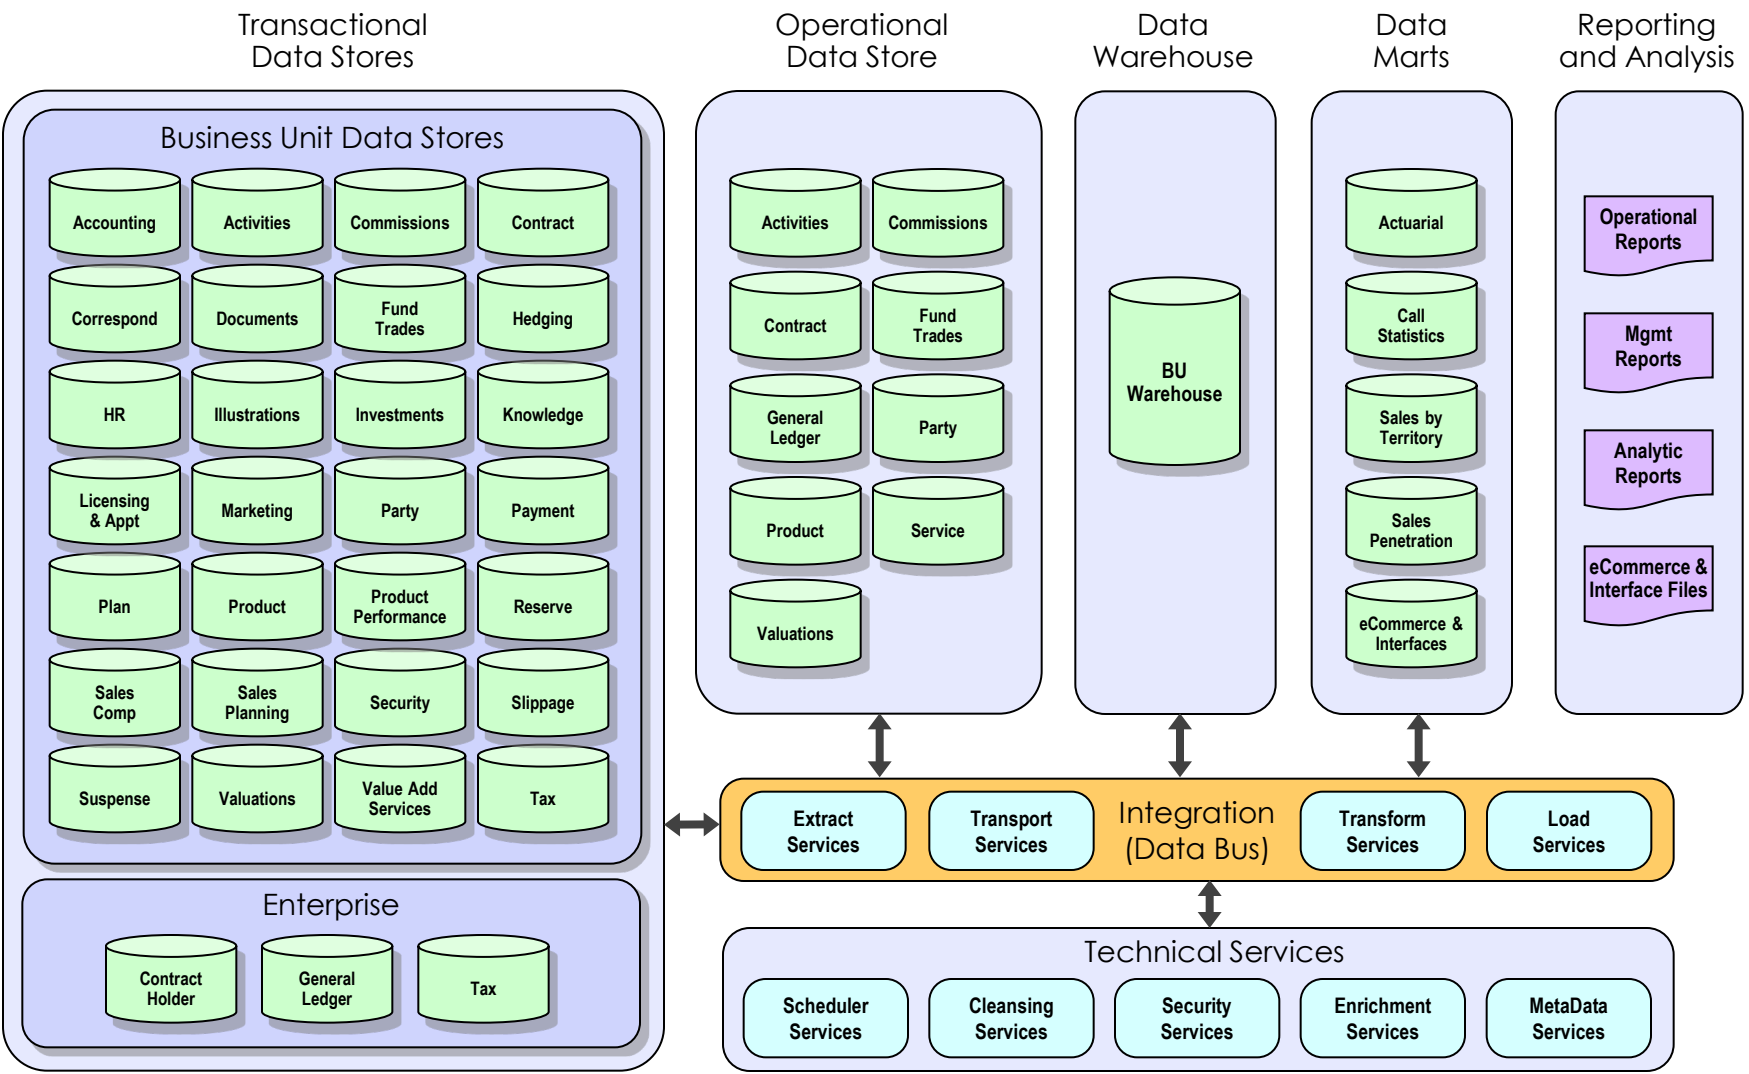

# Sample Application Architecture Blueprint

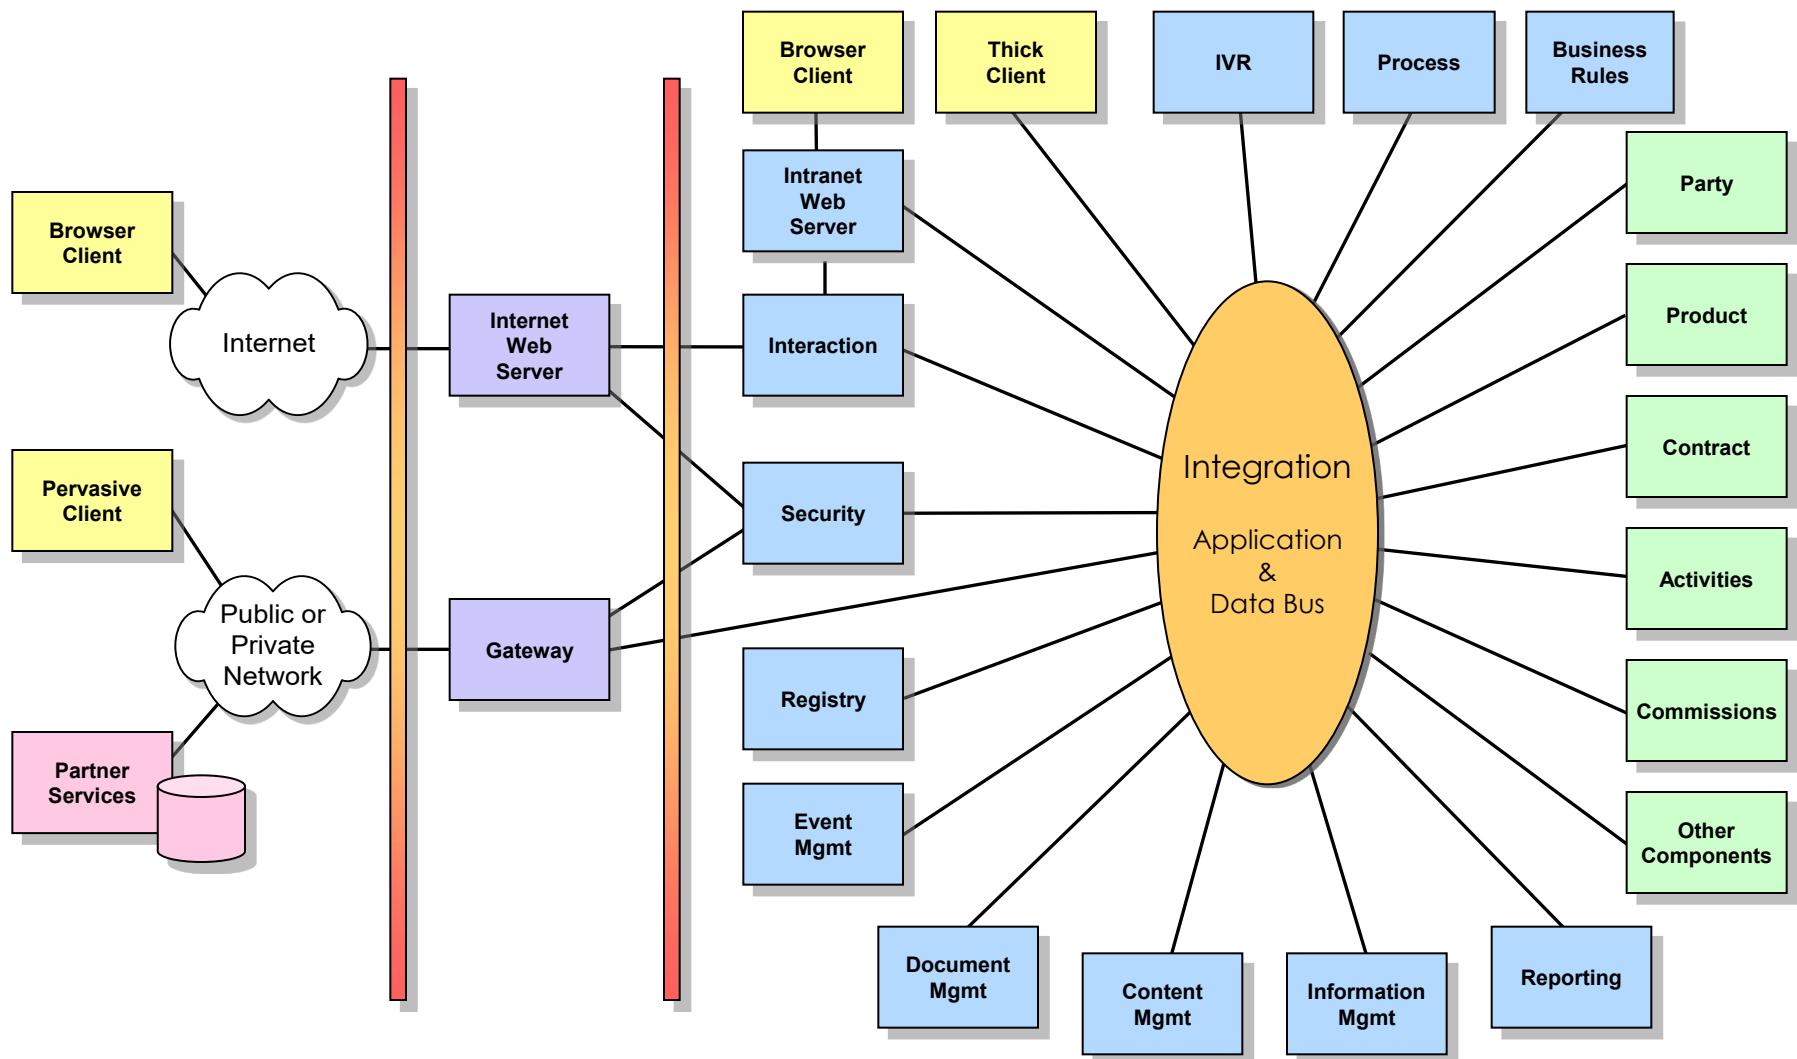

# Sample Information Systems Architecture Blueprint

# Sample Infrastructure Architecture Blueprint

# Agenda

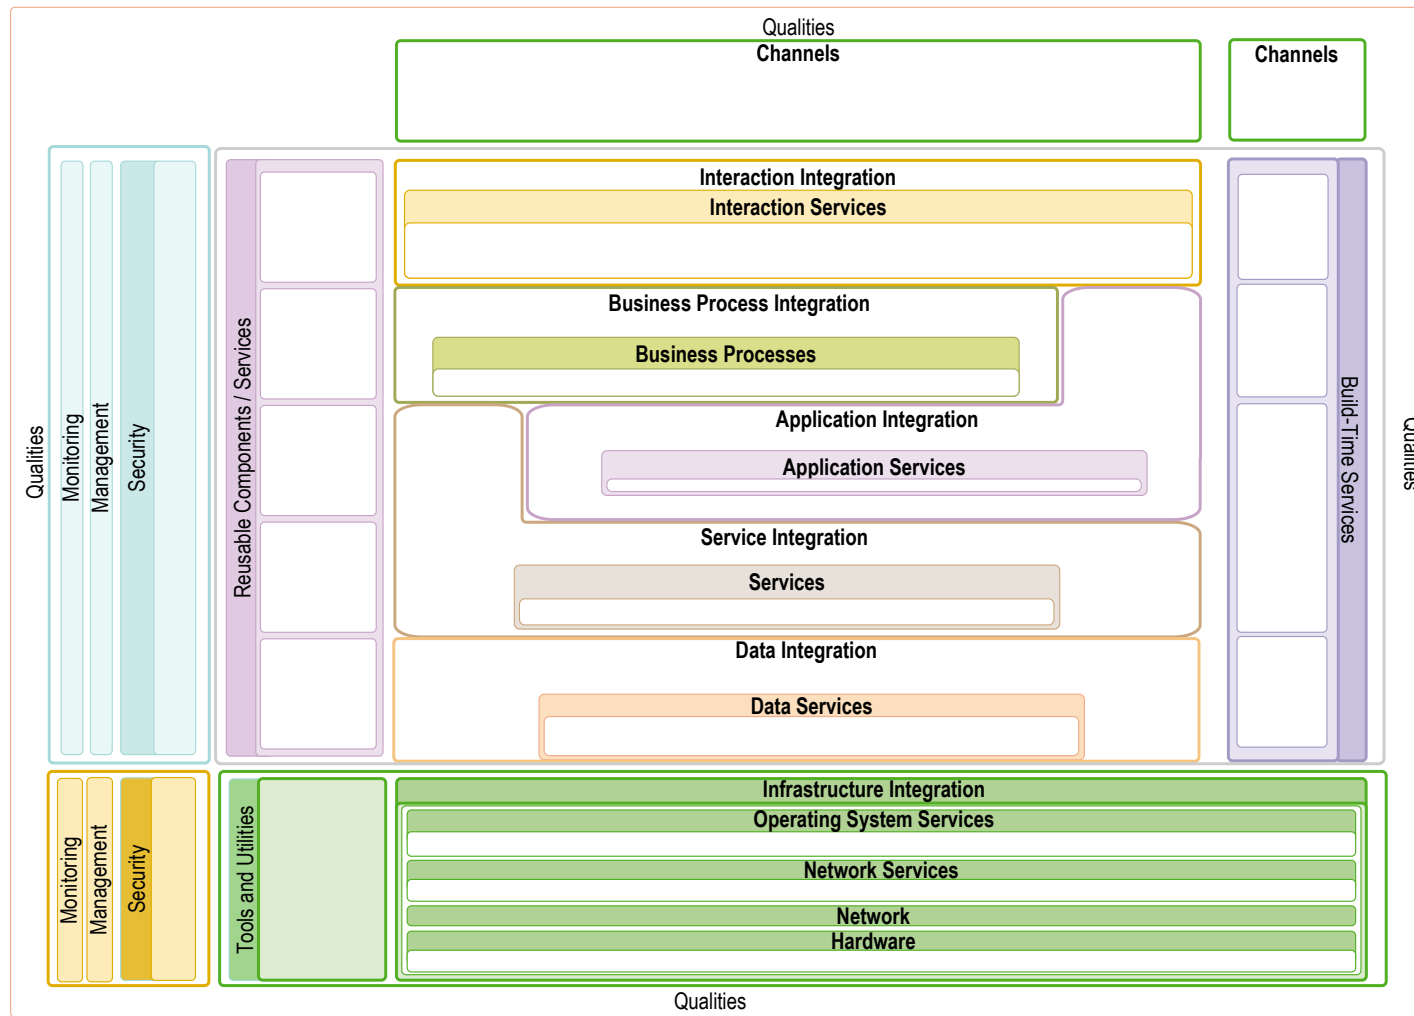

- 1 Introduction
- 2 High-Level Analysis and Design
- 3 Architecture Blueprinting
- 4 Sample Architecture Blueprints
- 5 Architectural Mapping Process Illustrated
- 6 Reference Architecture Cataloguing Framework
- 7 Summary and Conclusion

- Levels of abstraction
- Breadth (i.e., architectural domain)
- Depth (i.e., services/facilities needed)
- Specialization (i.e., styles and related pattern)
- Integration of various patterns results in integration variants/hybrids
- Mapping relies on the selection of standards and products that implement that standard
  - » e.g., JEE – IBM WebSphere Application Server

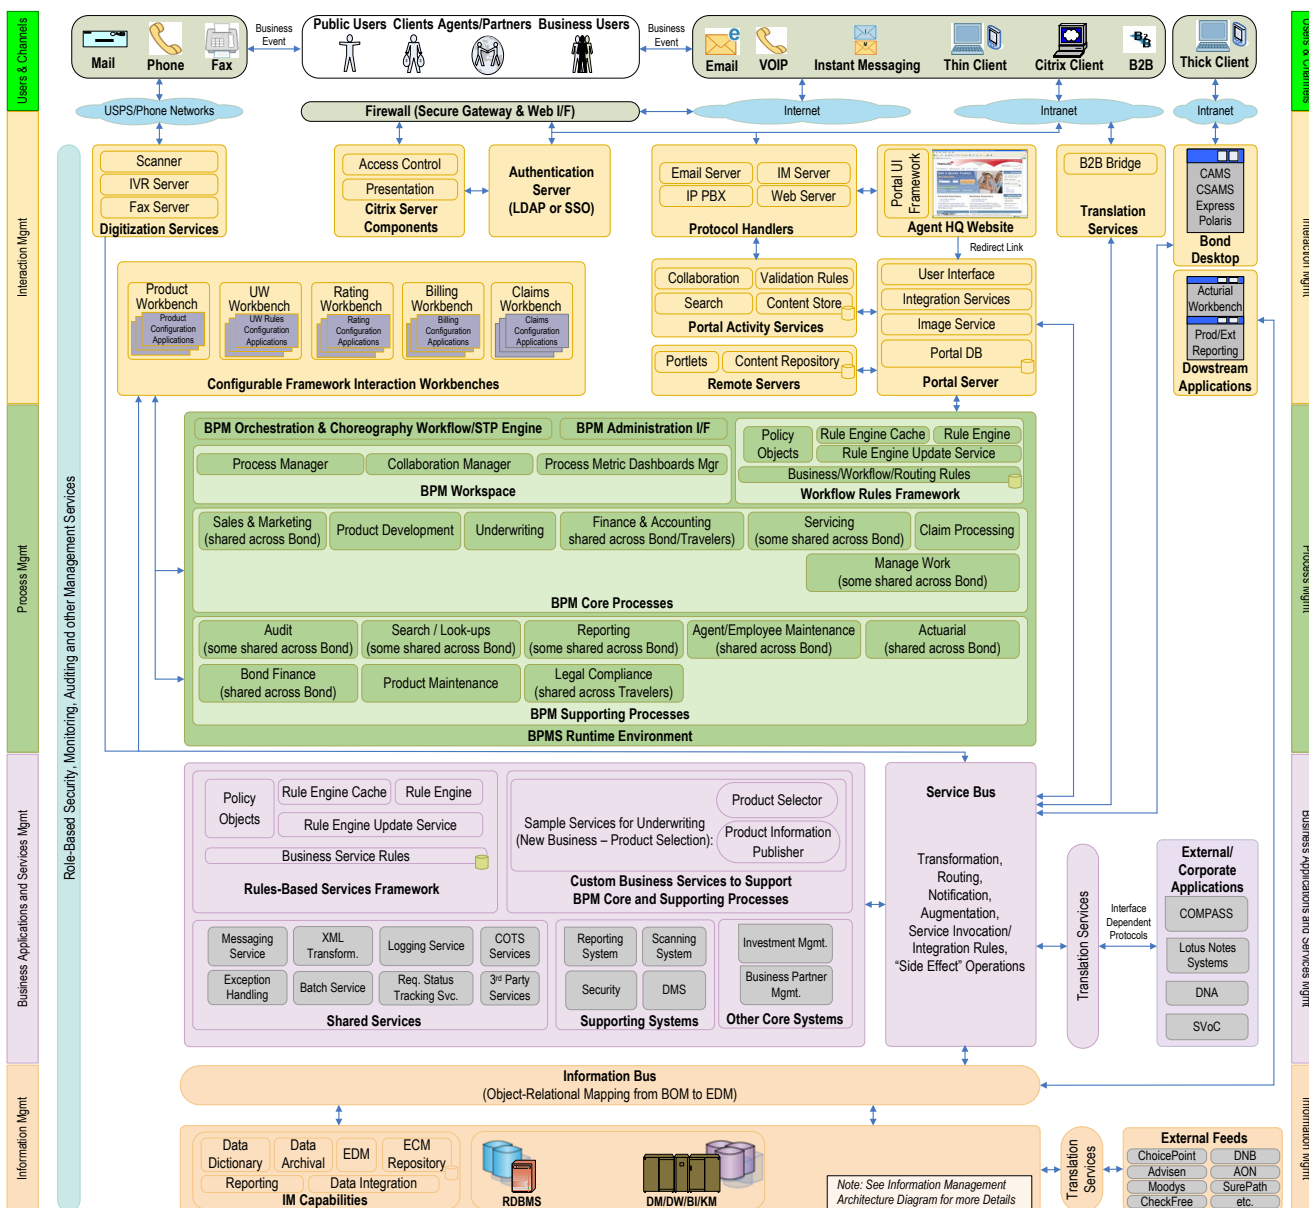

# Sample Reference Logical Application Architecture Blueprint (OMA / SOA Hybrid)

Separation of concerns through layering enables high cohesion and low coupling across the application components

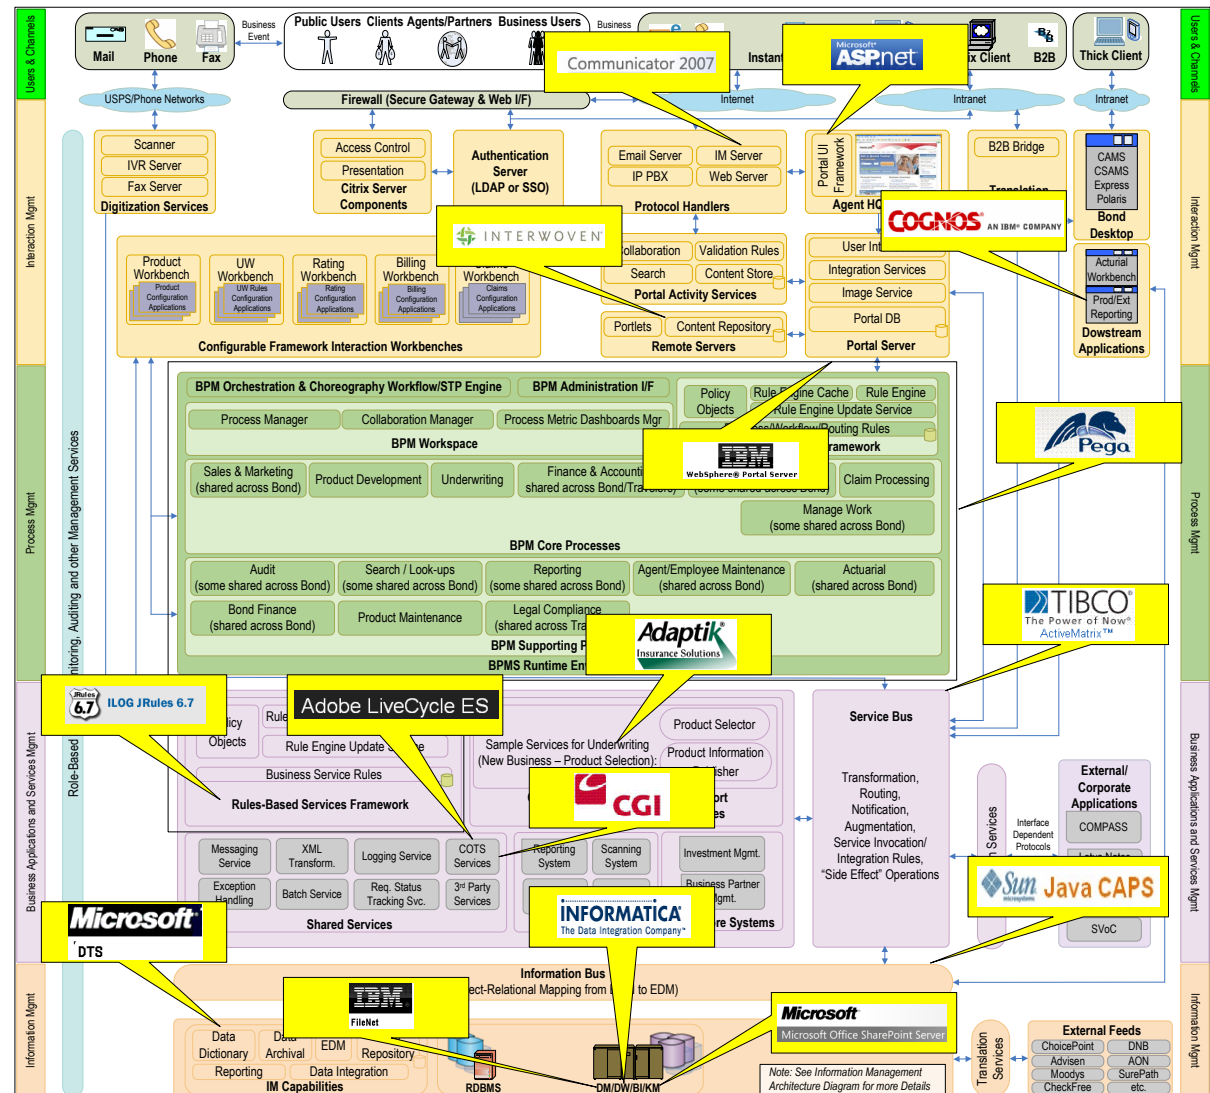

# Sample Reference Application Architecture Implementation Blueprint (OMA/SOA Hybrid)

# Technology Products Mapped to the Reference App. Arch. Impl. Blueprint (OMA/SOA Hybrid)

- Sample Product Mapping:
  - » JEE Standard
  - » IBM WebSphere Product Family
  - » Various Third Party Products (as indicated)

- 7 Summary and Conclusion

## Scope and Detail of Architectures

- Any Enterprise is likely to have many Solutions and Architectures
- Different Segments of the Enterprise, Product lines or Divisions
- Different Levels of Detail suitable for different purpose and audience
- Time horizon of an Architecture

## Specialization Hierarchy of Architectures

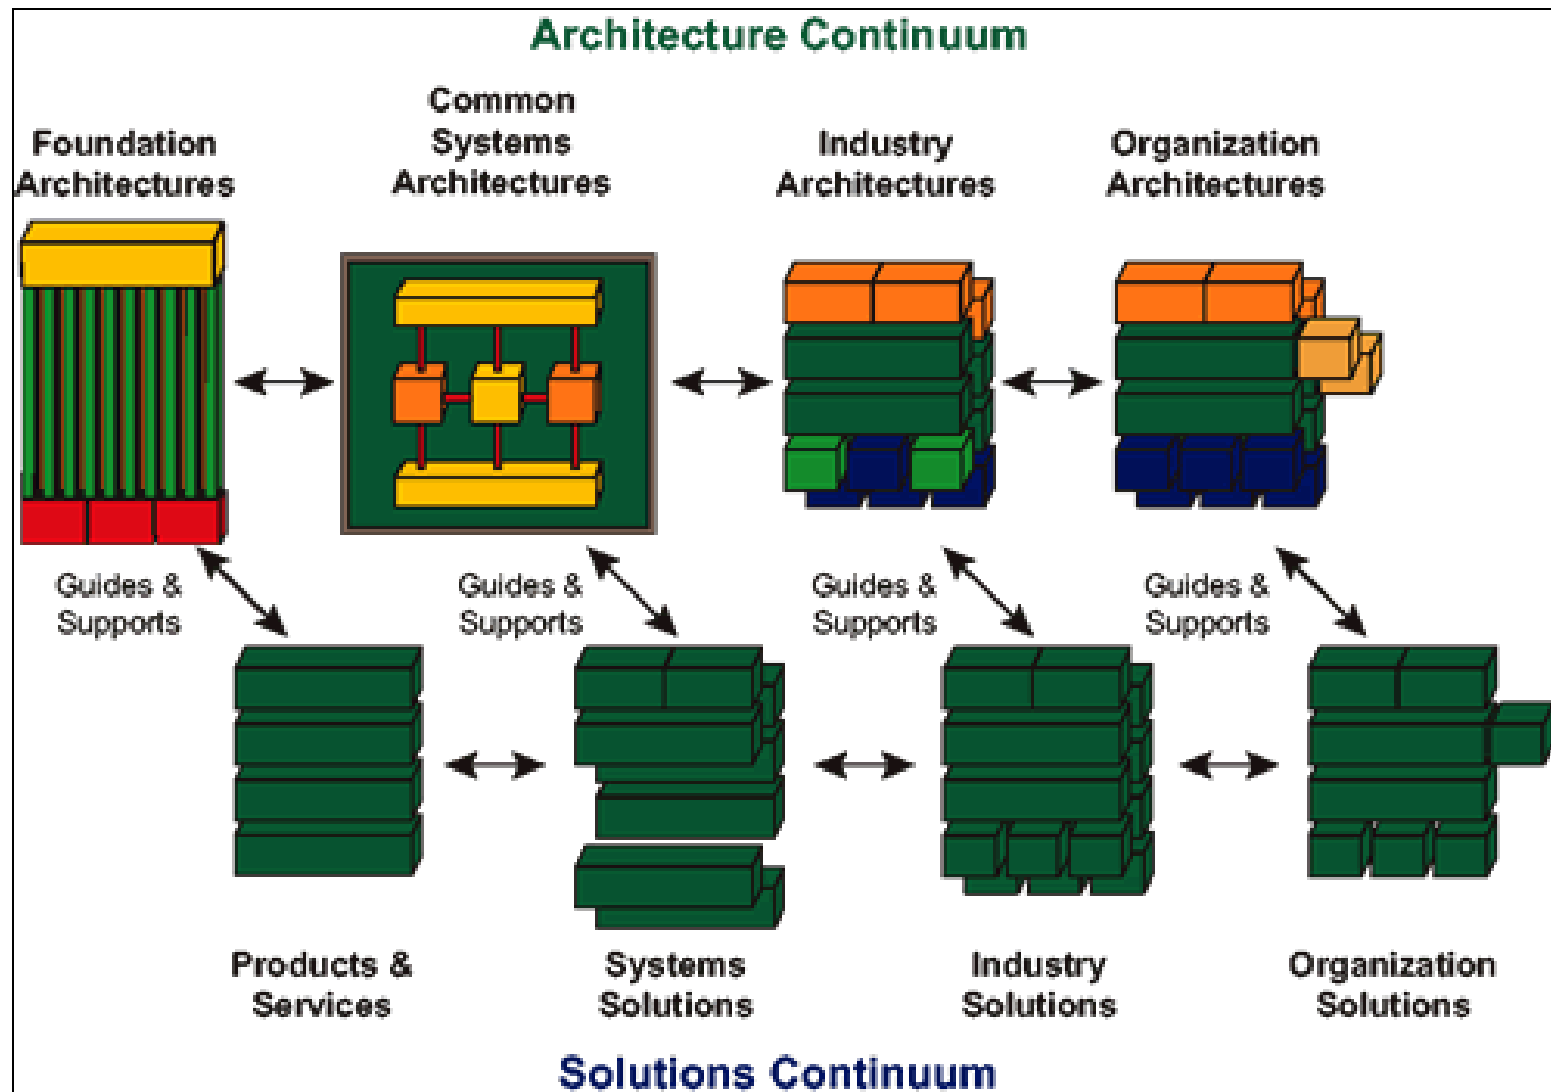

- Generic Architectures common to all industries
- Industry Specific Architectures
- Reference Architecture of a particular Organization
- ...

## Domains and Views of an Architecture

- Business Domain, Information Domain, Application Domain, Infrastructure Domain
- A Master Architecture can cover all these domains at a high level
- Each Domain can have a single comprehensive view of an Architecture
- Each Domain can have multiple views to cover an Architecture
- Specialized views for specific purposes within each domain

# Specialization Hierarchy for Architectures (TOGAF-Centric)

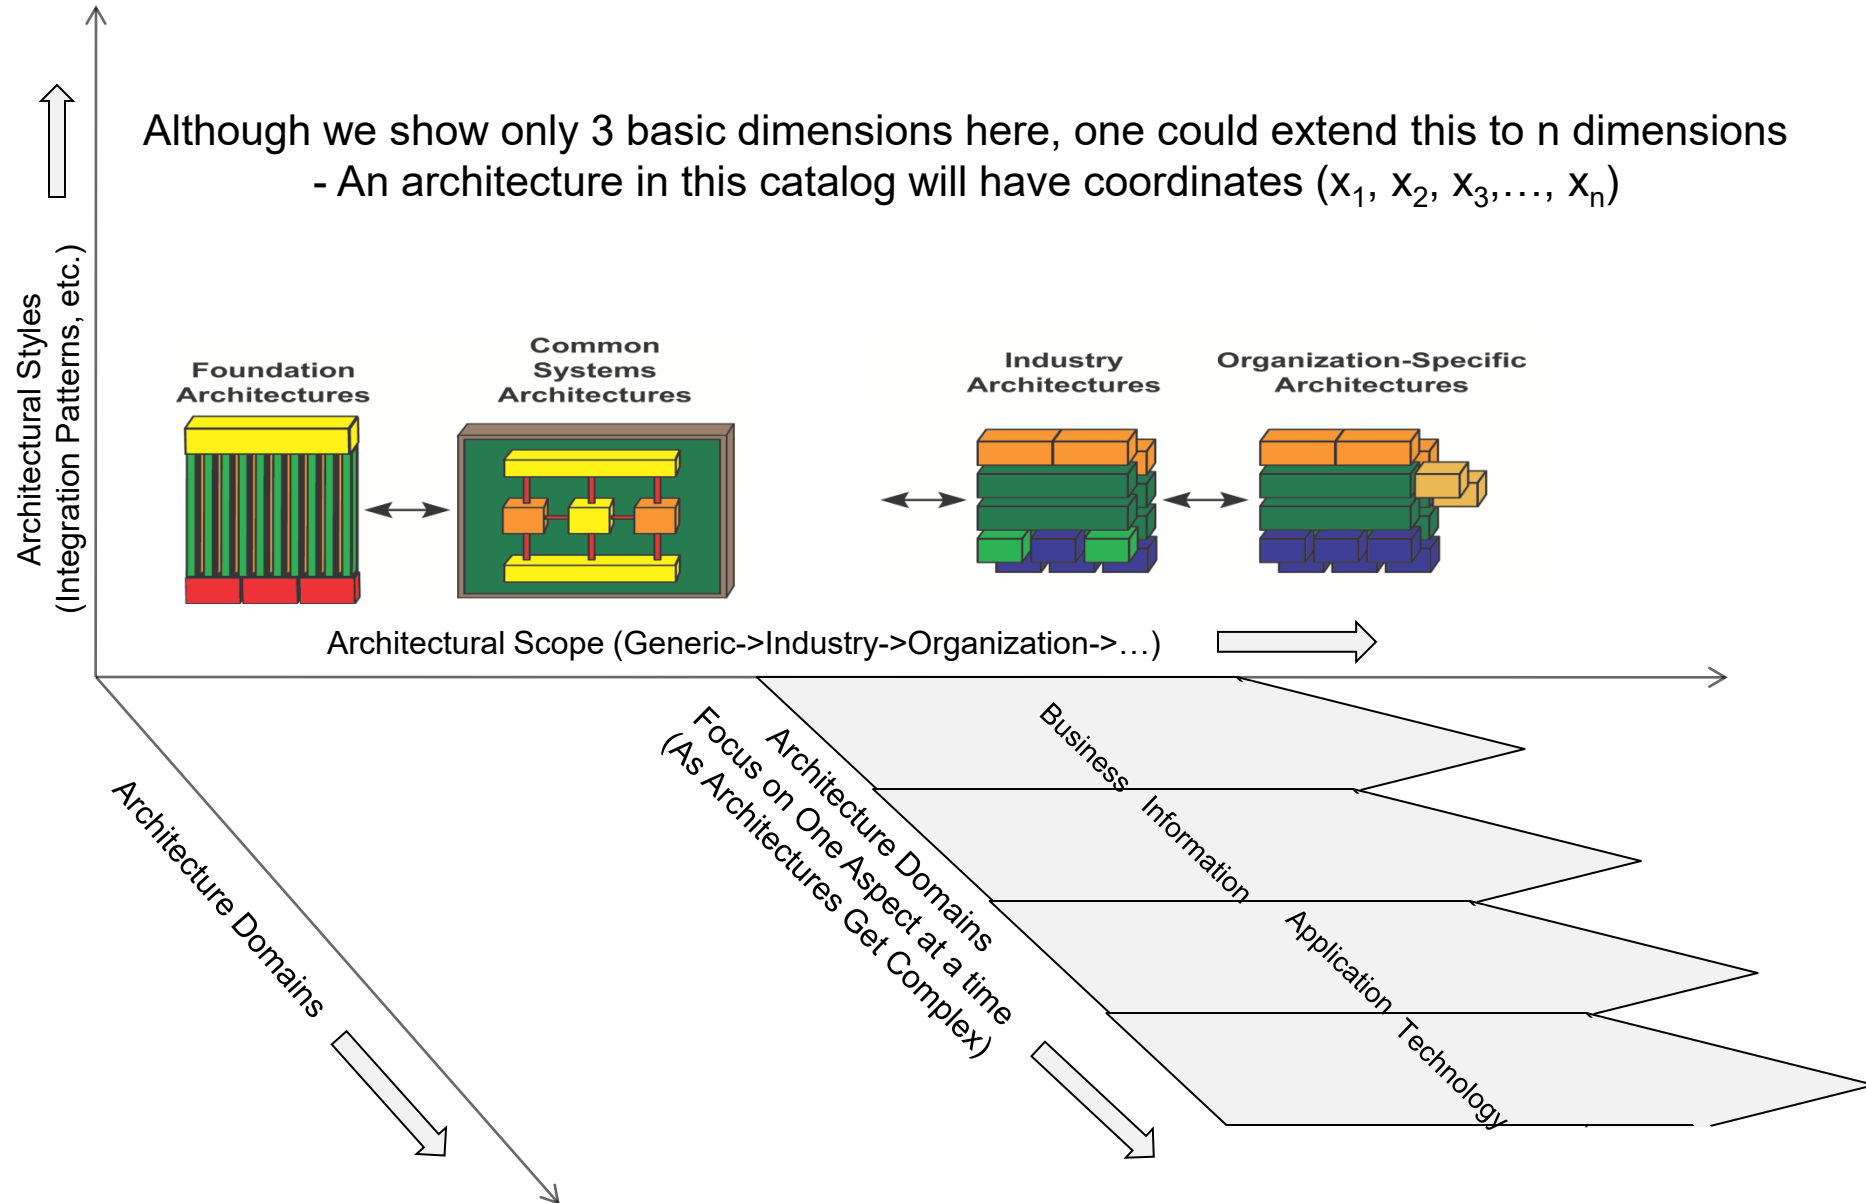

## ■ Objectives:

- A catalog with a scope comprehensive enough to hold all reference architectures blueprints in a meaningful and well-understood structure (i.e. be able to accommodate different types of reference architectures blueprints)
- A set of processes to access and maintain the catalog as well as the reference architectures in the catalog, so the reference architecture blueprints could be easily preserved and reused, providing the following functions:
  - Retrieve a specific reference architecture at any time, given the dimension specifications
  - Searchable given any dimension specifications
  - Allow adding variants to any existing reference architecture
  - Extendable in terms of new options (attributes) in each dimensions
